## D6.2 Report on the evaluation protocol

## robs4crops.eu

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 101016807

Author(s)/Organisation(s)	s) Michael G. Koutsiaras (AUA)			
Contributor(s)	<ul> <li>Inputs related to LSPs and measurable metrics (WP1) were provided by:</li> <li>Charles Duchemin &amp; Bertrand Pinel – Terrena (WP1 &amp; LSP1)</li> <li>Fouli Douka &amp; Mark Legas – Pegasus (LSP2)</li> <li>Oriol Serra – Serrater (LSP3)</li> <li>Han Hilbrands - Smart Agri Technology (LSP4)</li> <li>Reviewers:</li> <li>Frits van Evert (WUR)</li> <li>Alea Scovill ( Agrointelli)</li> <li>Charles Duchemin (Terrena)</li> </ul>			
Work Package	WP6			
Delivery Date (DoA)	31 December 2021			
Actual Delivery Date	19 December 2021			
Abstract:	This deliverable provides the detailed evaluation protocol for the large-scale pilots. It includes Key Performance Indicators (KPIs) derived from measurable metrics (WP1) and a methodology for the timely and efficient evaluation of each LSP and its associated robotic solutions. Moreover, individual evaluation templates and timeplan are provided, as well as information about the composition and envisioned contributions of the LSP Focus Groups.

#### 1 Introduction to the evaluation protocol

Deliverable D6.2, "Report on the evaluation protocol", defines the protocol that will be followed to evaluate the large-scale pilots. The report describes the methodology for assessing the implementation and the results of the experiments in accordance with the piloting plan (D6.1 Pilot Planning). Deliverable D6.2 is based on the individual piloting plans of the following pilots:

- a. LSP 1 France Vineyard and vegetable mechanical weeding with CEOL Robot (TERRENA);
- LSP 2 Greece CEOL and retrofitted tractor for spraying operations on table grapes (PEGASUS);
- c. LSP 3 Spain Apple orchards spraying with retrofitted tractor (SERRATER);
- d. LSP 4 The Netherlands Mechanical weeding with Robotti (SmartAgriTechnology).

For the definition of evaluation criteria and the creation of the evaluation templates, information from deliverable D1.4, "Measurable Metrics", is used. Deliverable D1.4, submitted in M6, describes the agricultural, technical and non-technical metrics that will be considered in the evaluation of the large-scale pilots, and are included in this evaluation protocol. These metrics, as well as additional information included in this deliverable, showcase information provided directly by pilot leader organisations.

This deliverable is to be validated and, if needed, adapted throughout the implementation of the evaluation activities for the large-scale pilots, and the submission of the reporting documents: deliverable D6.3, "Report on evaluating the performance of the robotic systems in real-environmental conditions", in M24, M36, and M48.

In the next sections of this document, the following items are included: evaluation methodology, individual evaluation criteria for large-scale pilots, evaluation report templates, timeplan, information on safety issues and the large-scape pilot focus groups.

#### 2 Evaluating Large-Scale Pilots

#### 2.1 Evaluation methodology

In order to implement an efficient and timely evaluation of the large-scale pilots, it is essential to initially define a plan on the means used (e.g., templates, meetings) and the timing of the actions to be taken (e.g., timing of pilot progress reporting, timing of meetings etc.). For evaluating the four large-scale pilots, WP6 leader (AUA) will utilise face-to-face online meetings and individual report templates. According to deliverable D6.1, "Pilot Planning", each large-scale pilot has a pre-defined timeline on the activities and measurements to be conducted. Based on cornerstone activities and their timing, largescale pilots will be invited to report on their activities and achievements reached, as well as problems encountered via online meetings with WP6 and reporting, using report templates, which are described in this deliverable. This work will be done in order to assess performance based on evaluation criteria. Moreover, in the criteria, information is given about the validation of the three minimum viable products (MVBs) of the large-scale pilots throughout the three years of implementation. It is crucial to highlight that pilot leaders will have to follow this evaluation protocol document throughout the whole pilot implementation, study their individual KPIs and be able to report on a monthly and annual basis, as described in the sections that follow in this deliverable.

#### 2.2 Evaluation criteria

The evaluation of the large-scale pilots will be conducted based on:

- a. agronomic, technical and other non-technical KPIs derived from D1.4, "Measurable metrics", with an additional KPI about social acceptance of the robotic solutions;
- b. the expected timeline presented in D6.1, "Pilot Planning";
- c. the measurements defined in D6.1, "Pilot Planning", to take place during pilot activities.

In the tables that follow in sections 2.2.1-2.2.4 (Tables 1,2,3,4), the KPIs are presented, including: (a) their relation to measurable metrics derived from WP1, (b) description/analysis of measurement, (c) timing of measurement and (d) target value/goal.

The KPIs have been grouped in three (3) major categories: agronomic, technical (including: Unmanned Ground Vehicle (UGV), Implements, Farming Controller & FMIS) and nontechnical (including: safety, labour, ethics, economics, social). Moreover, KPIs have been sub-grouped in the tables, using colour coding to indicate KPIs that have to be measured: (a) at the development phase of the pilot and (b) specific times during the project, several times during crop season or during every task/field operation.

These KPIs are going to be monitored using the evaluation templates provided in section 2.3. To add to this, during the lifespan of the pilots, the expected timelines regarding pilot activities and measurements (D6.1) will be evaluated and, if needed, adapted to the specific needs of each pilot. For this reason, large-scale pilots will be monitored in order to: (a) ensure accordance with the pre-defined timeline, (b) indicate possible changes/adjustments, (c) justify the adjustments, (d) ensure that, despite the possible adjustments, all KPIs will be measured and evaluated. This reporting will also be implemented using the evaluation templates, as well as regular online meetings, e-mail communications etc. Regarding the timing of KPI reporting and timeline monitoring, more information is included in section 2.4 of this document (Evaluation Timeplan).

#### 2.2.1 LSP 1 – France - KPIs

Below, the KPIs for LSP 1 are presented.

	AGRONOMIC KPIs						
КРІ	KPI title	Related measurable metric from WP1 (D1.4)	Measurement	Description	Target		
1	Plant damage/ destruction	MET_AGRO_1	Number of damaged or destroyed plants that are not normally expected to be wounded. <u>Timing: at</u> <u>least 2</u> <u>times/year</u>	Throughout the weeding season, analyse one-hectare equivalent of vine by following the UGV on different rows and record the number of damaged or destroyed plants. If a damaged or destroyed plant is detected, record the origin of the damage: cuttings poorly attached to their stakes, not straight row, implements badly adjust (too strong), robotic guidance or other origin.	<3% damage with a good quality of weeding (tool adjusted, and crop management adapt to robotic guidance law)

#### 2.2.2 LSP 2 - Greece - KPIs

Below, the KPIs for LSP 2 are presented.

#### Table 2 KPIs for the evaluation of LSP 2

			AGRONOMIC K	Pls	
KPI	KPI title	Related measurable metric from WP1 (D1.4)	Measurement	Description	Target
1	Plant damage/ destruction	MET_AGRO_1	Number of damaged or destroyed plants that are not predisposed to be wounded. <u>Timing: at</u> <u>least 2</u> <u>times/year</u>	Throughout the spraying season, analyse one-hectare equivalent of vine by following the UGV on different rows and record the number of damaged plants (broken cane, bunch of grapes damaged or destroyed) or destroyed plants (trunk cleaved or uprooted). If a damaged or destroyed plant is detected, record the origin of the damage: cuttings poorly attached to their stakes, not straight row, implements badly adjust (too strong), robotic guidance or other origin. <u>Crop damage % and crop</u> <u>destruction % related to</u> : -crop management (=cuttings poorly attached to their stakes and not straight row), -UGV guidance law, - Implement adjustment, - Other issues.	<10% in total (robotic system or other reason)
2	Agronomic performance of the robot	MET_AGRO_3	Agronomic satisfaction of the robotic system work <u>Timing: After</u> <u>each field</u> <u>operation</u>	End user or Ecosystem chair feedback with a 1 to 5 scale (very good, good, ok, bad, very bad).	At least feedback between "Ok" to "very good"
			TECHNICAL KP	···	
		Unmai	nned Ground Veh	icle (UGV)	

					,
3	Size of robot suitable for different crops	MET_TEC_UGV_05 b	Is the size of the robotic system suitable to the crop? <u>Timing: At the</u> <u>development</u> <u>phase</u>	Robot should be suitable to all vegetables (Sugar beets, pumpkin, onions, broccoli, lettuce etc.), vineyards and orchards. Record width between the rows of vine and the height where the robotic system cannot pass.	Common row spacing (1,40 cm to 3 m) Crop height and surrounding (pole, net) should match the UGV height.
4	Hardware present and operational	MET_TEC_UGV_17	Hardware is present and works on robot. Is there hardware for data transmission, for GNSS positioning, for mobile connection to the cloud? <u>Timing: At the</u> <u>development</u> <u>phase</u>	UGV is equipped with a connectivity system for data transmission, GNSS positioning, mobile connection to the cloud	Yes. Robot can operate successfully. Comment.
5	Electrical, hydraulic and PTO output to the implement	MET_TEC_UGV_20	Hardware is present and works on robot. <u>Timing: At the</u> <u>development</u> <u>phase</u>	The robotic platform should provide electrical, hydraulic and PTO output to the implement. Is there hardware to provide electrical, hydraulic and PTO output to the implement?	Robot can operate successfully with the implement.
6	Robotics platform regroups the data to communicate with the user	MET_TEC_UGV_22	GUI communicatin g information needed. <u>Timing: At the</u> <u>development</u> <u>phase</u>	Record all types of messages the robotic platform communicates. Confirmation that hard/software is available and functional.	The robot operator is able to receive the data s/he needs to make decisions and supervise.
7	3-point hitch	MET_TEC_UGV_07	Is the UGV equipped with an equivalent to a 3-point hitch. Does it have a 3-point hitch (ISO730, CAT I, II, or III)? <b>Timing:</b> At least once during the project (Before treatment season).	Do the implements and UGVs follow the same Cat or standard for the 3-point hitch dimensions and lifting capacity. Record the UGV 3-point hitch dimensions Record the 3-point hitch of the implement	Yes

			[ ·		[
8	AB lines import from GNSS system	MET_TEC_UGV_24	The AB lines are moved from a shape file to the robot management/ planning software. <u>Timing: When</u> <u>creating a new</u> <u>path planning</u>	Are AB lines displayed correctly in the robot management software? Ensure that AB lines from commercial systems in use in 2021 can be imported into the robotic system through FMIS and Farming controller interfaces.	No need for AB line setup should be necessary on the field robot itself.
9	Performing in wet clay soil	MET_TEC_UGV_12	Ability to perform a mission with implements in the limits of the robotic systems. <u>Timing:</u> <u>After the</u> <u>weeding</u> <u>season - At</u> <u>least once per</u> <u>year</u>	Use the heavier tool of the Large-Scale Pilot (up to 400 kg) and record the level of easiness of the robot to handle it in a wet clay soil (Very Easy - Easy - Suitable - Hard - Very hard)	At least "Suitable" to "Very Easy" assessment.
10	Autonomy of the whole robotic system	MET_TEC_UGV_04	The robot should have an autonomy of minimum 8 -10 hours. <u>Timing:</u> <u>During a</u> <u>specific test –</u> <u>once a year</u>	Let the robot run in a loop until it stops, and record time during the operation.	Time > 8hours
11	Teach in	MET_TEC_UGV_25	Precision of teach in and efficiency <u>Timing: Once</u> <u>a year after all</u> <u>field</u> <u>operation</u>	Teach in: Driving routes can be taught, including patterns of AB lines and connecting headland turns. Deviation of the teach in. End user feedback with a 1 to 4 scale (Very efficient, Efficient, Not efficient, Unusable)	Deviation < 5cm Feedback at least Efficient
12	Human intervention in robotic work	MET_TEC_UGV_01	Cases where the robotic system cannot work without human assistance <u>Timing:</u> <u>During field</u> <u>operations</u>	Record a description of the intervention and the time allocated to it. Record the total time used by the end user for the whole weeding operation. Determine the % of intervention time in relation to total time.	<10% intervention time
13	Farmer competences for using the robot	MET_TEC_UGV_01	Competences required for farm workers, using robotic systems for	Record the number of operations consider as harder than driving a tractor and the competences required to achieve them.	>10% easier operations

				Descend the average of	]
			repetitive work <u>Timing: At the</u> <u>end of each</u> <u>spraying</u> <u>season</u>	Record the number of operations consider as easier than driving a tractor and the competences required to achieve them.	
14	Deviation of the trajectory of the towing system.	MET_TEC_UGV_02	Deviation of the trajectory of the towing system. <u>Timing: After</u> <u>each</u> <u>operation</u>	Record the time of entry and the time of exit of 3 straight rows of the UGV. Record the speed of the UGV in those rows. Retrieve log of the UGV.	Percentage of deviation from the planned trajectory between 50 and 100 mm: <10% Percentage of deviation from the planned trajectory above 100 mm: <2%
15	Capacity of robot and tractor to work under different conditions	MET_TEC_UGV_05	Condition where a robot couldn't work and where a tractor could. <u>Timing: After</u> <u>field</u> <u>operation –</u> <u>when it</u> <u>happens</u>	In practice, mechanical weeding or spraying can only be done under certain conditions (weather, state of the soil (e.g., moisture level), and growth stages of both the crop and the weeds), the robot must be able to work at least in those conditions where a tractor could pass. Record all situations where a robot couldn't work and where a tractor could. Define the expected work. Record all operation of the field. Determine the % of operations carried out by a robot.	50% of tractor-based operations are carried out autonomously
16	Equipment breakdown. Reliability of the UGV.	MET_TEC_UGV_09	Number and Importance of the breakdown. Ability to repair. <u>Timing: All</u> <u>along the</u> <u>process –</u> <u>when it</u> <u>happens</u>	Record all breakdown (hardware or software) and record the time needed to repair and if help from the constructor was needed. Record if the issue is documented. Determine: Number and % of small breakdown: less than 1h of repairs and no need of help from constructor. Number and % of medium breakdown: less than 2 hours of repairs or help of the constructors Number and % of serious breakdown: more than 2 hours of repairs.	90% of all mechanical breakdowns are documented or can be repaired by a user equipped for mechanical interventions by season. 2 small breakdown max per month. 2 medium breakdown max per season.

					2 serious breakdown max per 10 years.
17	UGV works in low temperatures	MET_TEC_UGV_10	UGV Performing a mission in low temperatures <u>Timing:</u> <u>During fields</u> <u>operations –</u> <u>for each</u> <u>operation</u>	Record the temperature min of the environment when the robot was used without issues link to temperature.	Be able to work at low temperatures (-5°C).
18	UGV works in high temperatures	MET_TEC_UGV_11	UGV Performing a mission in high temperatures <u>Timing:</u> <u>During fields</u> <u>operations –</u> for each <u>operation</u>	Record the temperature min of the environment when the robot was used without issues link to temperature.	Be able to work in high heat (+40°C).
19	Improvement of guidance and U-turn of the UGV	MET_TEC_UGV_14	Areas for improvement of guidance and U-turn of the UGV <u>Timing:</u> <u>During fields</u> <u>operations –</u> <u>when it</u> <u>happens</u>	Record any movement that the robot does not do the way the farmer wants. Rate their importance: End user feedback with an 1 to 3 scale (Efficient, Not efficient, Unusable). Determine the number of "Unusable" comments.	Efficient. If not, optimize the path planning and reduce pass overs and soil compaction.
20	Level of system deterioration due to weather	MET_TEC_UGV_16	Does the weather significantly deteriorate the system? <u>Timing:</u> <u>During fields</u> <u>operations –</u> <u>when it</u> <u>happens</u>	The robot should be robust with an IP similar to tractors (IP 65-67). Record breakdown caused by the weather. Determine repetitive breakdowns of one component due to weather.	All robotic components are Robust (IP 65-67) or protected to have a similar robustness.
21	Trajectory optimisation/ Reduction of pass overs	MET_TEC_UGV_19	Number of pass overs. <u>Timing:</u> <u>During fields</u> <u>operations -</u> <u>At least twice</u> <u>per spraying</u> <u>season</u>	Record the number of pass overs during each operation.	< 2 pass overs
22	Correct calculation of the tank reserve	MET_TEC_UGV_21	Correct calculation of the tank reserve.	Does the Robotic system detect an empty tank during an operation? Is the tank empty?	Yes

an	-		machinery such that they	communication from the FC up to the implement/UGV.	

		[			,
			work together? <u>Timing: Once</u> <u>for each</u> <u>implement.</u>	Count incidences where help of dealer / manufacturer is required to make the implement and UGV work with the FC.	
33	Data retrieved from operations are properly displayed and understood	MET_TEC_F-C_06	End-users are able to find and understand the way the data is displayed. <u>Timing: One</u> <u>time per year</u> <u>with 5 users</u> <u>each time.</u>	Receive data from sensors: perception information from the field (examples: soil and weather conditions, 3D mapping of the field and the crops, GPS data for the position of the tractor, diesel level sensor, heat of engine sensor, remote supervision, camera data, etc.). Ask end-users a description of the information displayed. Ask them to find specific information (speed, position, progress of the mission etc.)	The farmer is able to find and understand the information that is displayed. The farmer is able to make decisions from the information displayed (ex: if the diesel levels are low, then he can refill, etc.).
34	Input information of each UGV and implement in the FMIS.	MET_TEC_F-C_11	Ability to input information of each UGV and implement in the FMIS. <u>Timing: Once</u> <u>for each robot</u> <u>and</u> implement.	Store description of all robots and implements on the farm (include weight, size, working width, fuel autonomy, source of fuel, which connectors are available, etc.) Indicate the ability or non- ability. Define data size.	Yes.
35	Prescription map for field operation	MET_TEC_F-C_12	Is the FMIS well construct to create a prescription map for field operation? <u>Timing: Once</u> <u>a year.</u>	End user feedback with a 1 to 4 scale (Nothing wrong, Efficient, Not efficient, Unusable)	At least "Efficient" to "Nothing wrong",
36	Performance assessment visualisation.	MET_TEC_F-C_13	Efficiency of the user interface to visualize as- applied information and performance assessment. <u>Timing: Once</u> <u>a year.</u>	End user feedback with a 1 to 4 scale (Nothing wrong, Efficient, Not efficient, Unusable).	At least "Efficient" to "Nothing wrong"
37	User interface inputs task- related parameters	MET_TEC_F-C_14	Efficiency of the user interface to input task-	End user feedback with a 1 to 4 scale (Nothing wrong, Efficient, Not efficient, Unusable)	At least "Efficient" to "Nothing wrong"

#### 2.2.3 LSP 3 – Spain - KPIs

Below, the KPIs for LSP 3 are presented.

#### Table 3 KPIs for the evaluation of LSP 1

	Related						
КРІ	KPI title	measurable metric from WP1 (D1.4)	Measurement	Description	Target		
1	Plant damage/ destruction	MET_AGRO_1	Number of damaged or destroyed plants that are not predisposed to be wounded. <u>Timing: at</u> <u>least 2</u> <u>times/year</u>	Throughout the spraying season, analyse one-hectare equivalent of trees by following the UGV on different rows and record the number of damaged trees (broken branch, apple damaged or destroyed) or destroyed tree (trunk damaged). If a damaged or destroyed tree is detected, record the origin of the damage: implements badly adjusted (too strong), robotic guidance or other origin. <u>Crop damage % and crop</u> <u>destruction % related to</u> : -crop management (=cuttings poorly attached to their stakes and not straight row), -UGV guidance law, - Implement adjustment, - Other issues.	<10% in total (robotic system or other reason)		
2	Agronomic performance of the robot	MET_AGRO_3	Agronomic satisfaction of the robotic system work <u>Timing: After</u> <u>each field</u> <u>operation</u>	End user or Ecosystem chair feedback with a 1 to 5 scale (very good, good, ok, bad, very bad).	At least feedback between "Ok" to "very good"		
	<u>,</u>	L	TECHNICAL KP	IS	1		
		Unmai	nned Ground Veh				
3	Size of robot suitable for different crops	MET_TEC_UGV_05 b	Is the size of the robotic system suitable to the crop? <u>Timing: At the</u> <u>development</u> <u>phase</u>	Robot should be suitable to all vegetables (Sugar beets, pumpkin, onions, broccoli, lettuce etc.), vineyards and orchards. Comparing the dimensions of the tractors that LSP3 uses in 2021 with UGV dimensions.	Same size as currently used tractor or smaller.		
4	Hardware present and operational	MET_TEC_UGV_17	Hardware is present and works on robot.	UGV is equipped with a connectivity system for data transmission, GNSS positioning, mobile connection to the cloud	Yes. Robot can operate

			operations		
13	Farmer	MET_TEC_UGV_01	Competences	Record the number of	>10% easier
	competences		required for	operations consider as harder	operations
	for using the		farm workers,	than driving a tractor and the	
	robot		using robotic	competences required to	
			systems for	achieve them.	
			repetitive	Record the number of	
			work	operations consider as easier	
			Timing: At the	than driving a tractor and the	
			end of each	competences required to	
			spraying	achieve them.	
			<u>season</u>		
14	Deviation of	MET_TEC_UGV_02	Deviation of	Record the time of entry and	Percentage of
	the trajectory		the trajectory	the time of exit of 3 straight	deviation from
	of the towing		of the towing	rows of the UGV.	the planned
	system.		system.	Record the speed of the UGV in	trajectory
			Timing: After	those rows.	between 50
			<u>each</u>	Retrieve log of the UGV.	and 100 mm:
			operation		<10%
					Percentage of
					deviation from

15	Obstacle detection and avoidance	MET_TEC_UGV_03	Can the robot detect case of emergency? Does the robot avoid collision? <u>Timing: In the</u> <u>off season –</u> <u>At least twice</u>	Place a heavy (+40 kg min) container in the middle of the passageway in place of a man: record if the robot detects the obstacle and slow down. Record if the robot avoid collision. If not record if the collision was violent.	the planned trajectory above 100 mm: <2% The obstacle is detected. Collisions are avoided.
16	Capacity of robot and tractor to work under different conditions	MET_TEC_UGV_05	per year Condition where a robot couldn't work and where a tractor could. <u>Timing: After</u> <u>field</u> <u>operation –</u> <u>when it</u> <u>happens</u>	In practice, mechanical weeding or spraying can only be done under certain conditions (weather, state of the soil (e.g., moisture level), and growth stages of both the crop and the weeds), the robot must be able to work at least in those conditions where a tractor could pass. Record all situations where a robot couldn't work and where a tractor could. Define the expected work. Record all operation of the field. Determine the % of operations carried out by a robot.	50% of tractor-based operations are carried out autonomously
17	Equipment breakdown. Reliability of the UGV.	MET_TEC_UGV_09	Number and Importance of the breakdown. Ability to repair. <u>Timing: All</u> <u>along the</u> <u>process –</u> <u>when it</u> <u>happens</u>	Record all breakdown (hardware or software) and record the time needed to repair and if help from the constructor was needed. Record if the issue is documented. Determine: Number and % of small breakdown: less than 1h of repairs and no need of help from constructor. Number and % of medium breakdown: less than 2 hours of repairs or help of the constructors Number and % of serious breakdown: more than 2 hours of repairs.	90% of all mechanical breakdowns are documented or can be repaired by a user equipped for mechanical interventions by season. 2 small breakdown max per month. 2 medium breakdown max per season. 2 serious breakdown max per 10 years.

			Implements	L	
24	Implement's ISOBUS compatibility	MET_TEC_IMP_06	Is the Communicatio n between ECUs (Electronics Control Unit) of vehicle and implement defined? <u>Timing: At the</u> <u>development</u> <u>phase</u>	CAN bus/ISOBUS compatibility.	ISOBUS based communicatio n within the implement- vehicle combination operate successfully.
25	Speed of the UGV	MET_TEC_IMP_01	Speed of the UGV. <u>Timing: After</u> <u>each field</u> <u>operation</u>	Tow implements that need a speed between 2km/h to 8 km/h. Record speed use for each implement. Record speed expectation for this tool. Record speed instruction (speed set in the path planning instructions). [speed difference for each tool= speed expectation- speed use]	speed difference <1km/h
26	Spraying coverage	MET_TEC_IMP_03	Is spraying homogeneous in all the canopy? <u>Timing:</u> <u>Before and</u> <u>After each</u> <u>field</u> <u>operation - At</u> <u>least twice per</u> <u>season</u>	<ul> <li>Place papers above 3 leaves, under 3 leaves, 3 in the alley, 3 in a row, 3 just out of the field.</li> <li>Spray with the robot. Check and record which paper are wet which are not.</li> <li>= Number of paper of one type wet / Total number of papers</li> </ul>	Above leaves: 100% Under leaves: 80%? In the alley: <5% Out of the field: 0%
27	Detection of nozzle obstruction	MET_TEC_IMP_04	Record of nozzle obstruction. Timing: After each field operation – when it happens	Record each nozzle obstruction. Record if the robotic system has detected it or not. Determine the % of not detected nozzle obstruction.	95% of nozzle obstruction detected.
28	Automated cleaning and maintenance	MET_TEC_IMP_05	Is the tank well cleaned? Is the maintenance of the sprayer enough? <u>Timing: After</u> <u>spraying</u> <u>operations -</u>	End user and technician feedback with a 1 to 5 scale (very good, good, ok, bad, very bad)	≤2

			At least twice		
29	Implement communicatio n with robotic platform / activating supply sources	MET_TEC_IMP_08	per seasonConsumptionof supplysources.Timing:During fieldoperation - Atleast twice perseason	Record situations where the robotic system can optimize its consumption (energy or consumable).	Robotic system can optimize its consumption.
30	Production of ISOXML files to be sent to the FMIS	MET_TEC_IMP_10	Recording the as-applied information of field application and producing ISOXML file available on the ISOBUS terminal. <u>Timing:</u> <u>During each</u> <u>field</u> <u>application</u>	Acquisition of as-applied amount (Sprayer) together with geo-location of applied points.	To represent the behaviour of the implements during field application.
31	Full load tank autonomy	MET_TEC_IMP_11	Full load a tank. Record the time taken for it to empty during autonomous operations. <u>Timing:</u> <u>During a</u> <u>spraying</u> <u>operation - At</u> <u>least twice per</u> <u>weeding</u> season	The user can fill the tank of the sprayer during a mission to a full-load tank autonomy of 60 min.	Autonomy of 60 min minimum
		Far	ming Controller 8	₹ FMIS	
32	Presentation of geospatial data	MET_TEC_F-C_15	Virtual map of the plot. <u>Timing: At the</u> <u>development</u> <u>phase.</u>	Is there a virtual map of the plot?	Presence of a virtual map of the plot usable during the operation for the end- user.
33	Communicatio n protocols between implements and the machinery established	MET_TEC_F-C_08	Is it possible to link implements and machinery such that they work together?	Establish communication protocols in all levels: Use of ISOBUS or TCP/IP or other protocols to enable communication from the FC up to the implement/UGV. Count incidences where help of dealer / manufacturer is required to make the	No incidences.

			<u>Timing: Once</u> <u>for each</u> <u>implement.</u>	implement and UGV work with the FC.	
34	Data retrieved from operations are properly displayed and understood	MET_TEC_F-C_06	End-users are able to find and understand the way the data is displayed. <u>Timing: One</u> <u>time per year</u> <u>with 5 users</u> <u>each time.</u>	Receive data from sensors: perception information from the field (examples: soil and weather conditions, 3D mapping of the field and the crops, GPS data for the position of the tractor, diesel level sensor, heat of engine sensor, remote supervision, camera data, etc.). Ask end-users a description of the information displayed. Ask them to find specific information (speed, position, progress of the mission etc.)	The farmer is able to find and understand the information that is displayed. The farmer is able to make decisions from the information displayed (ex: if the diesel levels are low, then he can refill, etc.).
35	Autonomy to respond to unforeseen events	MET_TEC_F-C_09	Robot's respond to unforeseen events in a graceful manner. <u>Timing:</u> <u>During a field</u> <u>operation – At</u> <u>least once a</u> <u>year</u>	Place a heavy (+40kg min) container in the middle of the passageway, on a headland, make the FC believe that the wind is rising, that it is starting to rain: in all cases, record the reaction of the robotic system. Determine if the reaction of the robotic system is appropriate (it bypasses the obstacle without damaged plants or skipping work it could do; it stops its operation due to weather issues;) Number of not appropriate reaction	Successful respond to unforeseen events.
36	Input information of each UGV and implement in the FMIS.	MET_TEC_F-C_11	Ability to input information of each UGV and implement in the FMIS. <u>Timing: Once</u> for each robot and implement.	Store description of all robots and implements on the farm (include weight, size, working width, fuel autonomy, source of fuel, which connectors are available, etc.) Indicate the ability or non- ability. Define data size.	Yes.
37	Prescription map for field operation	MET_TEC_F-C_12	Is the FMIS well construct to create a prescription map for field operation? <u>Timing: Once</u> <u>a year.</u>	End user feedback with a 1 to 4 scale (Nothing wrong, Efficient, Not efficient, Unusable)	At least "Efficient" to "Nothing wrong",

				spraying)	
				Cost per hectare of the task	
65	Social acceptance	-	Social Measure the social acceptance of the proposed robotic solution. <u>Timing: Once</u> <u>at the end of</u> <u>each year -</u> <u>Validation of</u> <u>the minimum</u> <u>viable</u> <u>product.</u>	End-user feedback. The robotic solution is: Not acceptable (no useful outcome, easiness to use, or benefit) – Acceptable (some benefit) - Highly acceptable (end-user identifies high benefit from the use of the robot)	Acceptable or highly acceptable.

# 2.2.4 LSP 4 – The Netherlands – KPIs

Below, the KPIs for LSP 4 are presented.

	AGRONOMIC KPIs						
КРІ	KPI title	Related measurable metric from WP1 (D1.4)	Measurement	Description	Target		
1	Plant damage/ destruction	MET_AGRO_1	Number of damaged or destroyed plants that are not	With a tractor and with a robot equipped with the 'smart' mechanical weeder and also with a conventional mechanical weeder, for each operation	<2% damage with a good quality of weeding		

			predisposed	follow the pulling system and	
			to be	record the number of damaged	
			wounded.	plants. Record the number of	
			Timing: at	plants per number of meters	
			least 2	analysed. If a damaged plant is	
			times/year	detected, record the origin of	
			times/year	the damage: not straight row,	
				implements badly adjust (too	
				strong), robotic guidance or	
				other origin.	
				Crop damage % and crop	
				destruction % related to:	
				-crop management (=cuttings	
				poorly attached to their stakes	
				and not straight row),	
				-UGV guidance law,	
				- Implement adjustment, - Other	
2	Dirty crops	MET_AGRO_2	Plants cover	issues. Qualify the condition of the	Dirty crops <
2	Dirty crops		with dirt or	knives (good - worn – broken).	20%
			sand	Record the number of dirty	2070
			Timing:	plants and plants studied.	
			Before and	Determine the percentage of	
			after weeding	dirty plants.	
			operation – At	anty plants.	
			least twice per		
			weeding		
			season		
3	Agronomic	MET_AGRO_3	Agronomic	End user or Ecosystem chair	At least
	performance		satisfaction of	feedback with a 1 to 5 scale	feedback
	of the robot		the robotic	(very good, good, ok, bad, very	between "Ok"
			system work	bad).	to "very good"
			Timing: After		
			each field		
			<u>operation</u>		
		Unma	TECHNICAL KP		
4	Size of robot	MET_TEC_UGV_05	Is the size of	Robot should be suitable to all	Track width of
	suitable for	b	the robotic	vegetables (Sugar beets,	the UGV must
	different	~	system	pumpkin, onions, broccoli,	match with
	crops		suitable to the	lettuce etc.), vineyards and	the row
	5.005		crop?	orchards.	spacing of the
			Timing: At the	Record the track width of the	crop or with
			development	machine, the width of the	multiple rows
			phase	knives, the height of the	of the crop
			+	machine	(per crop
					different,
					most common
					spacings are
					12,5cm; 25cm;
					50cm; 75cm.)
					Crop size and
					height should
					match the
					knives width
		1	1	1	

					and machine height
5	Hardware present and operational	MET_TEC_UGV_17	Hardware is present and works on robot. Is there hardware for data transmission, for GNSS positioning, for mobile connection to the cloud? <u>Timing: At the</u> <u>development</u> <u>phase</u>	UGV is equipped with a connectivity system for data transmission, GNSS positioning, mobile connection to the cloud	Yes. Robot can operate successfully. Comment.
6	Electrical, hydraulic and PTO output to the implement	MET_TEC_UGV_20	Hardware is present and works on robot. <u>Timing: At the</u> <u>development</u> <u>phase</u>	The robotic platform should provide electrical, hydraulic and PTO output to the implement. Is there hardware to provide electrical, hydraulic and PTO output to the implement?	Robot can operate successfully with the implement.
7	Robotics platform regroups the data to communicate with the user	MET_TEC_UGV_22	GUI communicatin g information needed. <u>Timing: At the</u> <u>development</u> <u>phase</u>	Record all types of messages the robotic platform communicates. Confirmation that hard/software is available and functional.	The robot operator is able to receive the data s/he needs to make decisions and supervise.
8	3-point hitch	MET_TEC_UGV_07	Is the UGV equipped with an equivalent to a 3-point hitch. Does it have a 3-point hitch (ISO730, CAT I, II, or III)? <u>Timing: At</u> <u>least once</u> <u>during the</u> <u>project</u> ( <u>Before</u> <u>weeding</u> <u>season).</u>	Do the implements and UGVs follow the same Cat or standard for the 3-point hitch dimensions and lifting capacity. Record the UGV 3-point hitch dimensions Record the 3-point hitch of the implement	Yes
9	AB lines import from GNSS system	MET_TEC_UGV_24	The AB lines are moved from a shape file to the robot management/ planning software.	Are AB lines displayed correctly in the robot management software? Ensure that AB lines from commercial systems in use in 2021 can be imported into the robotic system through FMIS	AB lines can be imported

			Time in a 14/1	and Family constraint	I
			Timing: When	and Farming controller	
			creating a new	interfaces.	
			path planning		
10	Performing in	MET_TEC_UGV_12	Ability to perform a	Use the heavier tool of the	At least
	wet clay soil		mission with	Large-Scale Pilot (up to 750 kg	"Suitable" to
			implements in	with Robotti 150D and 1500 kg	"Very Easy" assessment.
			the limits of	with Robotti LR kg) and record the level of easiness of the robot	assessment.
			the robotic	to handle it in a wet clay soil	
			systems.	(Very Easy - Easy - Suitable -

29	Production of ISOXML files to be sent to the FMIS	MET_TEC_IMP_10	Recording the as-applied information of field application and producing ISOXML file available on the ISOBUS terminal. <u>Timing:</u> <u>During each field application</u>	Acquisition of as-applied amount (Sprayer) together with geo-location of applied points.	To represent the behaviour of the implements during field application.
30	Full load tank autonomy	MET_TEC_IMP_11	Full load a tank. Record the time taken for it to empty during autonomous operations. <u>Timing:</u> <u>During a</u> <u>spraying</u> <u>operation - At</u> <u>least twice per</u> <u>weeding</u> <u>season</u>	The user can fill the tank of the sprayer during a mission to a full-load tank autonomy of 60 min.	Autonomy of 60 min minimum
		Fai	rming Controller 8	& FMIS	
31	Presentation of geospatial data	MET_TEC_F-C_15	Virtual map of the plot. <u>Timing: At the</u> <u>development</u> <u>phase.</u>	Is there a virtual map of the plot?	Presence of a virtual map of the plot usable during the operation for the end- user.
32	Communicatio n protocols between implements and the machinery established	MET_TEC_F-C_08	Is it possible to link implements and machinery such that they work together? <u>Timing: Once</u> <u>for each</u> implement.	Establish communication protocols in all levels: Use of ISOBUS or TCP/IP or other protocols to enable communication from the FC up to the implement/UGV. Count incidences where help of dealer / manufacturer is required to make the implement and UGV work with the FC.	No incidences.
33	Data retrieved from operations are properly displayed and understood	MET_TEC_F-C_06	End-users are able to find and understand the way the data is displayed.	Receive data from sensors: perception information from the field (examples: soil and weather conditions, 3D mapping of the field and the crops, GPS data for the position of the tractor, diesel level	The farmer is able to find and understand the information that is

			with 5 users each time.	remote supervision, camera data, etc.). Ask end-users a description of the information displayed. Ask them to find specific information (speed, position, progress of the mission etc.)	to make decisions from the information displayed (ex: if the diesel levels are low, then he can refill, etc.).
34	Input information of each UGV and implement in the FMIS.	MET_TEC_F-C_11	Ability to input information of each UGV and implement in the FMIS. <u>Timing: Once</u> for each robot and implement.	Store description of all robots and implements on the farm (include weight, size, working width, fuel autonomy, source of fuel, which connectors are available, etc.) Indicate the ability or non- ability. Define data size.	Yes.
35	Performance assessment visualisation.	MET_TEC_F-C_13	Efficiency of the user interface to visualize as- applied information and performance assessment. <u>Timing: Once</u> <u>a year.</u>	End user feedback with a 1 to 4 scale (Nothing wrong, Efficient, Not efficient, Unusable).	At least "Efficient" to "Nothing wrong"
36	User interface inputs task- related parameters	MET_TEC_F-C_14	Efficiency of the user interface to input task- related parameters. <u>Timing: Once</u> <u>a year.</u>	End user feedback with a 1 to 4 scale (Nothing wrong, Efficient, Not efficient, Unusable)	At least "Efficient" to "Nothing wrong"
37	Conditions to be met before execution of tasks	MET_TEC_F-C_01	Ability to input the conditions under which a task is performed into the robotic system. <u>Timing:</u> <u>Before</u> <u>starting fields</u> <u>operations -</u> <u>At least once</u> <u>per task</u>	Record if it is possible or not.	Yes, it is possible
38	Resources for the execution of tasks	MET_TEC_F-C_02	Ability to input the resources	Record if it is possible or not.	Yes, it is possible

			available or		
			not for each		
			task.		
			Timing:		
			Before		
			starting fields		
			operations -		
			At least once		
20	Country into our		per task	Description of the second state

	about the needs of the		Timing: Before starting a field operation - At		

43	Input task information in the FMIS.	MET_TEC_F-C_10	Ability to input information on each task in the FMIS. <u>Timing: Once</u> <u>a year - At</u> <u>least twice per</u> weeding	Store all field operations with related information (e.g., technical, financial, etc.) Indicate if it is possible or not to do it.	Yes.
			season.		
44	End-user's ability to intervene	MET_TEC_F-C_16	Can the end- user intervene at any time during an operation if the circumstances so require? <u>Timing: All</u> <u>along the</u> <u>process - At</u> <u>least twice per</u> <u>weeding</u> season.	Record case where the end user cannot intervene and what s/he would have done.	No cases occur.
45	Ability to pause and resume tasks.	MET_TEC_F-C_17	Can the operation be paused and resumed? <u>Timing:</u> <u>Before</u> <u>starting the</u> <u>weeding</u> <u>season.</u>	Record if the robotic system can be paused during its operation. Record if it can be resumed. Record the easiness of this process: End user feedback of their control of the robotic system with a 1 to 5 scale (very easy, easy, ok, difficult very difficult).	Both possible. At least "ok" to "very easy".
			NON-TECHNICAL		
			Safety		
46	Data security	MET_N-TEC_saf_03	Ensure that data cannot be improperly accessed or modified). <u>Timing: Once</u> <u>a year.</u>	Use an expert, like a data integrity expert, cloud security expert from one of the institutes to perform an integrity test (From the land survey to the robotic mission and data record by the robotic system in the field).	99% uptime guaranteed of the robot.
47	Compliance with Machine directive and the EU legislations	MET_N-TEC_saf_04	Check the list of standards and regulations collected in WP1 are compliant with the robotic system. <u>Timing: Once</u> <u>a year.</u>	Send list to robot supplier for verification that the standards are harmonized. Number of standards company is in compliance/not in compliance.	Robotic companies are in compliance with the required standards so the product can be CE marked.

## 2.3 Evaluation templates

In the following sections, the individual evaluation templates for the large-scale pilots are presented.

### 2.3.1 Evaluation template for LSP 1

#### LSP 1 - FRANCE - VINEYARD AND VEGETABLE MECHANICAL WEEDING WITH CEOL ROBOT

Name of the person reporting: Indicate your name

Organisation: Indicate your organisation

Day/Month/Year: Indicate date of reporting

Period of reporting: *Indicate the reporting period* 

This evaluation report serves the purpose of monitoring the timeline execution and KPIs of your LSP. Follow the guidelines provided in red "*Italic*" letters and fill in the whole report template. In case some KPIs or activities have not been measured/executed during the period of reporting, indicate the time you are planning to measure/execute them in the comments section (5th column). This evaluation report corresponds to the 3-year execution of your LPS, thus to the 3 minimum viable products of your robotic solution.

### TIMELINE MONITORING

	Expected timeline	Have you followed the expected timeline?	Are there any deviations from the expected timeline?	Comments about the execution of the timeline.
Сгор		YES/NO	YES/NO	<i>Give your comments about the activities conducted. Describe any possible deviations from the expected timeline and give a justification. Explain if these deviations impacted the monitoring of KPIs.</i>
	2021: Receipt and first technical tests			
Vineyards	March to July: Six (6) passes with three (3) tools in three (3) fields with 2 to 3 weeks between each pass.			
	October to December: Preparation of the robotic passages (land survey as example), plus co-design session.			
	<b>2022: Preparation</b> Testing the robotic solution with two (2)			

farmers on their farms, two (2) fields for R&D tests, one (1) co-design session and a few demonstrations of the robotic system. January: Receival of robot. Update of the robots already there. February: One (1) pass with a tool to de-earth (with a tractor if not possible with CEOL) March to July: Six (6) passes with 1/2 weeks between each pass. Measurements and Validation. At the end of each pass debrief will be done to decide if adaptations are needed / Test of new tools in the R&D fields / Adaptation between each pass during the "free" week. (Co-design session?) July to August: Validations and preparation for the next year. October to December: One (1) pass with disks harrow to earth-up and preparation of the robotic solution with 4 farmers on their farms, plus two (2) fields for R&O test, one (1) co- design session. 2023: "Industrialization" of the procedure: Test the robotic system to everybody asking. Same process as 2022 2024: Commercialization on Large Scale: Test the robotic solution with			
tests, one (1) co-design session and a few demonstrations of the robotic system. January: Receival of robot. Update of the robots already there. ### 2.3.2 Evaluation template for LSP 2

# LSP 2 – GREECE – CEOL AND RETROFITTED TRACTOR FOR SPRAYING OPERATIONS ON TABLE GRAPES Name of the person reporting: *Indicate your name*

Organisation: Indicate your organisation

Day/Month/Year: Indicate date of reporting

Period of reporting: *Indicate the reporting period* 

This evaluation report serves the purpose of monitoring the timeline execution and KPIs of your LSP. Follow the guidelines provided in red "*Italic*" letters and fill in the whole report template. In case some KPIs or activities have not been measured/executed during the period of reporting, indicate the time you are planning to measure/execute them in the comments

section (5th column). This evaluation report corresponds to the 3-year execution of your LPS, thus to the 3 minimum viable products of your robotic solution.								
	TIMELINE MONITORING							
		Have you followed the expected timeline?	Are there any deviations from the expected timeline?	Comments about the execution of the timeline.				
Expected timeline	Expected activities	YES/NO	YES/NO	Give your comments about the activities conducted. Describe any possible deviations from the expected timeline and give a justification. Explain if these deviations impacted the monitoring of KPIs.				
Start to February 2022	Preparations: Measurements, Farm Dimensions, Photos', Purchase							
	of tractor, Robot set up.							
February – September 2022	Robot Implementation and observation of method during cultivation							
October 2022- January 2023	Analyse data and make necessary adjustment, if needed.

	Which of the following pests and malnutritions have you treated during the execution of the LSP?					
	Period	Pes	ts and malnutricions (sele	ect from below)	Comments	
	Indicate one or more pests and malnutricions treated for each period: • Powdery & downy Mildew • Botrytis • Grineria • Lobesia botrana • Thrips • Plannoccus • Malnutrition Zn, Fe, K			Please, provide any additional comments about the treatments.

# 2.3.3 Evaluation template for LSP 3

LSP 3 – SPAIN – APPLE ORCHARDS SPRAYING WITH RETROFITTED TRACTOR

Name of the person reporting: *Indicate your name* 

Organisation: Indicate your organisation

Day/Month/Year: Indicate date of reporting

Period of reporting: *Indicate the reporting period* 

This evaluation report serves the purpose of monitoring the timeline execution and KPIs of your LSP. Follow the guidelines provided in red *"Italic"* letters and fill in the whole report template. In case some KPIs or activities have not been measured/executed during the period of reporting, indicate the time you are planning to measure/execute them in the comments section (5th column). This evaluation report corresponds to the 3-year execution of your LPS, thus to the 3 minimum viable products of your robotic solution.

TIMELINE MONITORING						
		Have you followed the expected timeline?	Are there any deviations from the expected timeline?	Comments about the execution of the timeline.		
Expected timeline	Expected activities	YES/NO	YES/NO	Give your comments about the activities conducted. Describe any possible deviations from the expected timeline and give a justification. Explain if these deviations impacted the monitoring of KPIs.

### 2.3.4 Evaluation template for LSP 4

#### LSP 4 – THE NETHERLANDS – MECHANICAL WEEDING WITH ROBOTTI

Name of the person reporting: *Indicate your name* 

Organisation: Indicate your organisation

Day/Month/Year: Indicate date of reporting

Period of reporting: *Indicate the reporting period* 

This evaluation report serves the purpose of monitoring the timeline execution and KPIs of your LSP. Follow the guidelines provided in red "*Italic*" letters and fill in the whole report template. In case some KPIs or activities have not been measured/executed during the period of reporting, indicate the time you are planning to measure/execute them in the comments section (5th column). This evaluation report corresponds to the 3-year execution of your LPS, thus to the 3 minimum viable products of your robotic solution.

	TIMELI		ING	
		Have you followed the expected timeline?	Are there any deviations from the expected timeline?	Comments about the execution of the timeline.
Expected timeline	Expected activities	YES/NO	YES/NO	Give your comments about the activities conducted. Describe any possible deviations from the expected timeline and give a justification. Explain if these deviations impacted the monitoring of KPIs.

# 2.4 Evaluation timeplan

As mentioned previously in this document, the evaluation of the large-scale pilots will be implemented using online meetings and evaluation report templates.

### 2.4.1 Online meetings

Regarding the online meetings, these will take place each month, initiating interaction in January 2022. One monthly meeting will be organised with all LSP leaders in order to:

- a. Give updates on the execution of the timeline;
- b. Inform about the developments of the LSPs;
- c. Inform about possible deviations from the expected timeline and activities;
- d. Indicate possible problems encountered during pilot activities and try to find solutions;
- e. Make sure that the evaluation protocol is followed throughout the implementation of the LSPs and follow-up on the KPIs that have to be measured during all the stages of pilot implementation.
- f. Briefly report on the assessments of the LSP Focus Groups on pilot activities.

#### 2.4.2 Reporting via individual evaluation templates

The official evaluation of the LSPs and their minimum viable products will be implemented using the evaluation templates presented in this deliverable (section 2.3). Although the activities, measurements, timeline and alignment with the KPIs of the LSPs will be monitored on a monthly basis (online meetings), three official reporting periods will take place, one during the end of each experimental year, from August to October (2022, 2023, 2024). These reports will summarise all the activities, KPIs and outcomes of the LSPs, validating the three minimum viable products for each pilot. The outcomes from this reporting will support the work of Task 6.3, "Deployment, feedback collection and performance assessment in real environment", and provide input for deliverable D6.3, "Report on evaluating the performance of the robotic systems in real-environmental conditions", delivered in M24,36,48.

### 3 Large-Scale Pilot Focus Groups

In the context of WP6, Focus Groups (FGs) for each large-scale are being introduced. FGs consist of technical people, agronomy experts and field technicians. They will contribute in the work of LSPs by continuously evaluate the performance, usefulness, and benefits of the implemented solutions, as compared to their routine operations and decision making. Meetings of LSP leaders and FG members will take place on a regular basis, and feedback from FGs' assessments will be reported in the frame of WP6 (monthly meeting and annual reporting)<sup>2</sup>. In the table below, the FG members for each LSP are presented.

#### Table 5 LSP Focus Groups

Large-Scale Pilot	Focus Group members
LSP 1 - France – Vineyard and vegetable mechanical weeding with CEOL Robot	<ul> <li>Famers: at least 4, one of them is from the French institute of wine (IFV), 3 others are producers.</li> <li>Crop advisors: at least 3, from Loire-Vini- Viti-Distribution (LVVD).</li> <li>field technicians, 1 from AgreenCulture, 2 from Terrena, 1 from LVVD.</li> <li>2 agronomists, 1 from Terrena, 1 from LVVD.</li> </ul>
LSP 2 - Greece – CEOL and retrofitted tractor for spraying operations on table grapes	<ul> <li>Mark Legas, President</li> <li>Spiros Karachalios, Agronomist - Grower consultant</li> <li>Theodore Kokiousis, Project Manager</li> </ul>
LSP 3 - Spain - Apple orchards spraying with retrofitted tractor	• Field expert: Raül Sánchez • Agronomist: Oriol Serra • Technician: Josep Vidal
LSP 4 - The Netherlands - Mechanical weeding with Robotti	<ul> <li>Bram Veldhuisen (Technical expert)</li> <li>Menko Oosterhuis (Farm technician)</li> </ul>

<sup>&</sup>lt;sup>2</sup> See the last section of the individual evaluation templates (sections 2.3.1-2.3.4)
